(54) **Title: PROCESS FOR THERMAL TREATMENT OF GRANULAR IRON ORE BEFORE REDUCTION**

(57)**Abstract:** The wet granulated iron ore is initially conducted through a drying zone. The ore leaves the drying zone at a temperature of 120–400° C. The ore is then heated in direct contact with hot gas to temperatures of 700–1,100° C before being delivered to a reduction zone. The ore coming out of the drying zone is fully or partially guided through a separating device so as to separate the ore into fine and coarse grain fractions. The fine–grained ore fraction is conveyed to a granulating device so as to produce an iron ore granulate which is conducted to the drying zone. The coarse–grained ore fraction is heated to temperatures of 700–1,100° C before it is guided into the reduction zone.

<p>(54) Title: METHOD FOR SMELTING FINE GRAINED DIRECT REDUCED IRON IN AN ELECTRIC ARC FURNACE</p>	
<p>(57) Abstract: According to the invention, direct reduced iron of at least 80 wt. % and having a maximum grain size of 3 mm is smelted in an electric arc furnace. The furnace contains a bath comprised of liquid iron. During operation of the furnace, a foamed slag layer forms on the bath. The direct reduced iron falls into the foamed slag layer and onto the iron bath through at least one movable lance by means of gravitational force. The distance of the lance opening from the iron bath is preferably maintained in an approximately constant manner.</p>

<p>(57) Abstract: The invention relates to a method of producing melamine. According to the inventive method, the NH₃ containing melamine melt that is discharged from a melamine high-pressure reactor is expanded in a fluidized bed reactor that is substantially operated with NH₃ as the process gas, optionally after separation of the off gases, aging and cooling the melt. The melt is cooled with solid melamine or solid inert substances and solidified. Cold NH₃, preferably liquid NH₃ is added to the process gas that is optionally pre-treated by means of cyclones and/or filters to purify it, thereby allowing the precipitation of solid melamine.</p>

(54) **Title: METHOD FOR REMOVING COARSE-GRAINED SOLIDS FROM A STATIONARY FLUIDIZED BED**

(57) **Abstract:** According to the invention, a fluidizing gas is introduced upwards into the fluidized bed (3) through a valve grid (2), said stationary fluidized bed (3) containing solids with different grain sizes. A supply pipe (10) is disposed in the area of the fluidized bed, the mouth of said pipe being located above the valve grid (2) and its outlet (12) leading outwards from the fluidized bed (3). Part of the solids located above the valve grid (2) is blown into the supply pipe by a gas jet (13) which is directed upwards and fed separately from the fluidizing gas and pneumatically evacuated from the fluidized bed through the supply pipe (10). Normally, the flow speed of the gas in the supply pipe is at least two times higher than the speed of the fluidizing gas in the fluidized bed.

SCHEDULE ABOVE REFERRED TO—DESCRIPTION OF PIPELINE

<i>Route</i>	The 457.2 mm (18-inch) liquid pipeline commences at landfall La Brea Village, Mayaro-Guayaguayare Road and passes through undulating secondary forested terrain. It then crosses the existing 152.4 mm (6-inch) bpTT and 254.0 mm (10-inch) Petrotrin pipelines. The pipeline continues 6.4 m (21 feet) south of the existing 154.2 mm (6-inch) bpTT condensate pipeline until it crosses in a NW direction below the existing 154.2 mm (6-inch) bpTT and 254.0 mm (10-inch) Petrotrin pipelines to pass 6.4 m (21 feet) north of the 254.0 mm (10-inch) Petrotrin pipeline.
